

M. NUFAIL ISMATH

Senior Blockchain Developer | Full Stack & Backend Engineer

+94 75 241 4061 | Colombo, Sri Lanka (GMT +5:30) | [Email](#) | [Medium](#) | [LinkedIn](#) | [GitHub](#)

SUMMARY

Experienced Software Engineer with expertise in Blockchain, Backend and Full Stack Development. Having delivered 10+ projects and managed and made major contributions to multiple blockchain and backend systems end to end. Skilled in backend frameworks including NestJS and Express, database design and architecture, smart contract development and Web3 integration. Committed to implementing innovative solutions to complex challenges using cutting-edge technologies, and to delivering superior outcomes that exceed expectations in fast-paced, dynamic environments.

EXPERIENCE

Coding Legends (08/2023 – present)

Senior Blockchain Developer (11/2023 – present)

- As a Senior Blockchain Developer, I lead blockchain initiatives from concept to delivery while also owning backend development and database architecture across multiple projects. Highlights of my work include:
 - **Project Ownership:** Managed and made major contributions to the Clean ID and DEEDX projects across both blockchain and backend, taking key responsibility for architecture, development and delivery.
 - **AASL & IOM (Backend & Database Architecture):** Led the backend development and designed the complete database architecture for the AASL and IOM projects. Delivered a Dynamic Template Architecture for permits — a key project requirement — within two working days. Also performed client-side requirement gathering and handled DevOps tasks such as server configuration and maintenance.
 - **Backend Frameworks:** Transitioned from Express to NestJS for these projects and built strong proficiency in NestJS while retaining my Express expertise — I now work confidently with both.
 - **Blockchain Projects:** Play a key role in crafting and bringing the initial concept to reality — developing smart contracts, integrating Web3 technologies, creating educational content and meeting a wide range of client needs, with a focus on decentralized solutions that transform industries.
 - **Problem Solver:** Leverage in-depth knowledge of blockchain frameworks and protocols to design solutions that meet technical requirements and contribute to clients' business goals.
 - **Collaboration:** Work closely with diverse teams to translate complex business needs into innovative solutions, sharing knowledge and supporting teammates to deliver exceptional results.

Fullstack and Blockchain Developer (08/2023 – 11/2023)

- Played a pivotal role in translating visionary concepts into tangible products across industry boundaries. Working with dedicated project squads, I scoped unique requirements, architected systems, and built products from the ground up using my expertise in blockchain and Web3 technologies — contributing from inception through to successful deployment.

Niftron — Full Stack / Blockchain Developer (06/2021 – 06/2023)

- **DePro** — A decentralized profile that lets users manage their profile and certificate NFTs in a decentralized way. Developed the DePro contract handling core logic such as certificate issuance, profile creation and claims management, and built the blockchain integration and relay service for the project.
- **IPFS Node Deployment** — Successfully deployed a private IPFS node on a Kubernetes cluster, configured to operate exclusively within the organization's network, enabling seamless addition and retrieval of NFT metadata and other data from our own IPFS node.

- **Payment Gateway Service** — Developed a payment gateway service that monitors payment statuses using a listener to track payments, check prices and currency on-chain, and update MongoDB. Used the Moralis server to listen to a wallet address for incoming payments, streamlining the payment process and ensuring accurate tracking.

Cubo Systems — Trainee Software Engineer (08/2019 – 07/2020)

- **Xelution Health** — Contributed to the platform's frontend by designing and implementing the UI for patient and doctor consultation pages, and troubleshooting UI bugs, helping deliver a paperless, software-assisted patient data management system with care-protocol guidance.
- **EDoc** — As part of a team of four, helped develop a virtual doctor consultation mobile app using Flutter and .NET. Managed and designed the app's UI in Flutter/Dart and integrated the Twilio video conferencing service for seamless virtual consultations.

SKILLS

Languages & Frameworks: TypeScript, NestJS, Express, NodeJs, React, Next, Solidity, Java, C#, .Net
Blockchain & Web3: L1 & L2 Blockchain, Smart Contracts, Web3 Integration, Stellar, Bitcoin, Hyperledger, IPFS

Backend & Data: Backend Development, Database Design & Architecture, Architectural Decision-Making, PostgreSQL, MongoDB, SQL

DevOps & Infrastructure: Server Configuration & Maintenance, Kubernetes, GCP, GKE

Tools: Foundry, Hardhat, Truffle, Remix IDE, GCP, GKE

EDUCATION

BEng (Hons) in Software Engineering — University of Westminster (2018–2021)

Foundation in Higher Studies — Informatics Institute of Technology (2017–2018)

GCE Ordinary Level – Cambridge — Minhal International Boys School (2003–2016)

ACHIEVEMENTS

- Participated in the EthGlobal Hackathon.
- Participated in the Filecoin FEVM Hackathon.
